Much of the attraction to sodium (Na) batteries as candidates for large-scale energy storage stems from the fact that as the sixth most abundant element in the Earth's crust and the fourth most abundant element in the ocean, it is an inexpensive and globally accessible commodity. Significant.

The growing demand for low-cost electrical energy storage is raising significant interest in battery technologies that use inexpensive sodium in large format storage systems. Potentially viable candidate technologies today include relatively mature molten sodium batteries and emerging sodium ion.

A Sodium-ion battery (NIB, SIB, or Na-ion battery) is a rechargeable battery that uses sodium ions (Na^+) as charge carriers. In some cases, its working principle and cell construction are similar to those of lithium-ion battery (LIB) types, simply replacing lithium with sodium as the intercalating.

Sodium-ion batteries (SIBs) are emerging as a compelling alternative to lithium-ion batteries (LIBs), primarily due to the abundant availability and low cost of sodium resources. As the demand for energy storage solutions continues to grow, SIBs offer a promising pathway to meet energy storage.
