Beacon Power will design, build, and operate a utility-scale 20 MW flywheel energy storage plant at the Humboldt Industrial Park in Hazle Township, Pennsylvania for Hazle Spindle LLC, the Recipient of the ARRA Cooperative Agreement. The plant will provide frequency regulation services to grid.

Flywheels have been used to store energy in rotation for centuries. However, they were previously not suited for storing electrical energy because of their lower operating speed. tied to operate at the grid frequency. FESSs have high energy density, durability, and can be cycled frequently without.

Among all the different technologies of energy storage, the flywheel energy storage system (FESS) is fast becoming a leading technology for frequency regulation with fast response, long life, and high-efficiency specifications. Technology is gaining more and more focus as an important requisite for.

The coupling of thermal units with flywheel energy storage system can effectively improve the frequency regulation performance of AGC, solve the problems of long response time, slow climbing rate and low regulation accuracy of thermal units when tracking AGC commands, and obtain the auxiliary.

long cycle life and flexibility in providing ancillary services to the grid, such as frequency regulation, voltage support, etc. The fundamentals of the technology and recent developments are reviewed, firstly with an emphasis on the design considerations and performance metrics. Then the.
