# Ghana Flow Battery

## Overview

---

Are flow batteries the future of energy storage?

Flow batteries, with their ability to create a more stable grid and reduce grid congestion, are considered a promising technology for energy storage. Their adoption is closely linked with the surging energy storage market and can help fill renewable energy production shortfalls.

How will the flow battery market grow?

The flow battery market is expected to grow significantly as the share of renewables increases in the primary energy mix. Despite their higher CapEx cost compared to lithium-ion batteries, flow batteries are expected to be used extensively for both front-of-the-meter and behind-the-meter applications in the next several years.

What are the typical chemistries used in flow batteries?

Typical flow battery chemistries include all vanadium, iron-chromium, zinc-bromine, zinc-cerium, and zinc-ion. A flow battery is an electrochemical cell that converts chemical energy into electrical energy as a result of ion exchange across an ion-selective membrane that separates two liquid electrolytes stored in separate tanks.

Do flow batteries degrade?

That arrangement addresses the two major challenges with flow batteries. First, vanadium doesn't degrade. "If you put 100 grams of vanadium into your battery and you come back in 100 years, you should be able to recover 100 grams of that vanadium—as long as the battery doesn't have some sort of a physical leak," says Brushett.

What makes VRB energy different from other flow batteries?

VRB Energy's long-lasting vanadium flow batteries are reliable, recyclable, safe, and scalable. What sets them apart from other battery systems is their

ability to last longer than other flow batteries. Other prominent flow battery companies include Rongke Power, Redflow Ltd., and KORID ENERGY (KE).

Why are flow batteries so popular?

Flow batteries have the potential for long lifetimes and low costs in part due to their unusual design. In the everyday batteries used in phones and electric vehicles, the materials that store the electric charge are solid coatings on the electrodes.
