# How high is the voltage of the grid-connected inverter

## Overview

---

What is the input voltage of a grid connected inverter?

Inverter input voltage usually depends on inverter power, for small power of some 100 the voltage is 12 to 48 V. For grid connected inverters common input voltage range is from 200 to 400 V or even more. Grid connected inverters can be connected in parallel when higher powers are required.

What is a grid tie inverter?

The grid tie inverter (GTI) must match the phase of the grid and maintain the output voltage slightly higher than the grid voltage at any instant. A high-quality modern grid-tie inverter has a fixed unity power factor, which means its output voltage and current are perfectly lined up, and its phase angle is within 1° of the AC power grid.

What is a high voltage grid connected inverter?

The high-voltage grid-connected inverter has a high-voltage output capacity. The AC grid-connected voltage levels of 1100V DC high-voltage inverters are generally 480Vac, 500Vac, 540Vac, etc., and the AC grid-connected voltage level of 1500V DC high-voltage inverters is 800Vac.

What is a high-voltage grid connection?

Next, we will explain in detail the differences between these two grid connection methods. High-voltage grid connection usually refers to directly connecting a photovoltaic power station to a medium-high voltage power grid. Its voltage level is generally above 10 kilovolts. Common voltage levels include 10 kV, 35 kV, etc.

Can a PV inverter be disconnected from a grid?

Some properties of a PV inverter grid connection can cause the grid voltage at the inverter to increase and exceed the permissible operating range if the feed power is high. If this occurs, SMA grid guard, an independent

disconnection device integrated into the inverter, will safely disconnect the inverter from the grid.

What if the average grid voltage exceeds 260 volts?

The average grid voltage (UAC) at the inverter as measured over a period of 10 minutes is limited to a maximum of 253 V in Germany according to DIN VDE 0126-1-1. If the inverter records that the 10-minute average exceeds this voltage limit, or if the 260 V limit is temporarily exceeded, it will switch off immediately.
