Microinverter configuration requirements

Overview

This guide explains the working principle of micro inverters and outlines key factors to consider when selecting the right micro inverter, including voltage characteristics, rated voltage/current, and grid requirements. What is the configuration of a solar system with a microinverter?

The configuration of the system with a microinverter is flexible. Solar panels that are installed at different tilt angles can be connected to an inverter and different types of panels with different technologies can be connected to different microinverters.

What are the requirements for a solar inverter system?

There are two main requirements for solar inverter systems: harvest available energy from the PV panel and inject a sinusoidal current into the grid in phase with the grid voltage. In order to harvest the energy out of the PV panel, a Maximum Power Point Tracking (MPPT) algorithm is required.

What is a solar microinverter reference design?

The Solar Microinverter Reference Design is a single stage, grid-connected, solar PV microinverter. This means that the DC power from the solar panel is converted directly to a rectified AC signal. This conversion is done by an interleaved flyback converter.

What is a microinverter configuration?

Unlike centralized, string or multi-string configurations that aggregate and convert power generated by arrays of BIPV modules, the microinverter configuration (Fig. 2) evolved as a means for improving upon the shortcomings associated with the aforementioned inverter configurations .

What is a solar microinverter system?

The term, “microinverter”, refers to a solar PV system comprised of a single low-power inverter module for each PV panel. These systems are becoming

more and more popular as they reduce overall installation costs, improve safety and better maximize the solar energy harvest. Other advantages of a solar microinverter system include:.

Do microinverters meet NEC requirements?

The microinverter and cable connectors, as part of the product listing, meet the requirements of the NEC. Section 690.15 requires that inverters (including microinverters) include disconnects from all sources of power and that the disconnecting means are grouped at or within sight of the inverter.
