New Energy Supporting Energy Storage Prices

Overview

What is New York's 6 GW energy storage roadmap?

New York's 6 GW Energy Storage Roadmap, which recommends the deployment of six GW of energy storage, also authorizes funds for NYSERDA to support 200 megawatts (MW) of new residential-scale energy storage and 1,500 MW of new commercial and community-scale energy.

Is energy storage the future?

The key conclusion of the research is that deployment of energy storage has the potential to increase significantly—reaching at least five times today's capacity by 2050—and storage will likely play an integral role in determining the cost-optimal grid mix of the future.

What is bulk energy storage & how can it help New York?

New York Secretary of State Walter Mosley said, "In looking ahead for the state's future, bulk energy storage can provide the ability to store excess electricity during times of lower usage or high renewable production and return that electricity to the grid during peak times when it's needed most."

Do energy storage systems cover green energy plateaus?

Energy storage systems must develop to cover green energy plateaus. We need additional capacity to store the energy generated from wind and solar power for periods when there is less wind and sun. Batteries are at the core of the recent growth in energy storage and battery prices are dropping considerably.

Can energy storage reduce New York's climate goals?

Emerging long-duration and multi-day energy storage technologies can lower the annualized system costs of achieving New York's 2030 climate goals by 6 percent (\$0.4 billion/year) compared to scenarios in which lithium-ion batteries are the only available storage technology.

Should bulk energy storage be added to New York's grid?

Adding bulk energy storage to New York's grid will lower costs, optimize the generation and transmission of power, enhance energy grid infrastructure, and ensure the reliability and resilience of the State's electricity system.
