The voltage of the last two groups of lithium battery pack is high

Overview

What is a lithium battery voltage chart?

A lithium battery voltage chart is an essential tool for understanding the relationship between a battery's charge level and its voltage. The chart displays the potential difference between the two poles of the battery, helping users determine the state of charge (SoC).

What should you know about lithium ion batteries?

The most important key parameter you should know in lithium-ion batteries is the nominal voltage. The standard operating voltage of the lithium-ion battery system is called the nominal voltage. For lithium-ion batteries, the nominal voltage is approximately 3.7-volt per cell which is the average voltage during the discharge cycle.

What is the difference between a lithium ion and a discharged battery?

The chart displays the potential difference between the two poles of the battery, helping users determine the state of charge (SoC). For example, a fully charged lithium-ion cell typically has a voltage of 4.2V, while a discharged cell may have a voltage of 3.0V or lower.

What is the relationship between voltage and charge in a lithium ion battery?

The relationship between voltage and charge is at the heart of lithium-ion battery operation. As the battery discharges, its voltage gradually decreases. This voltage can tell us a lot about the battery's state of charge (SoC) - how much energy is left in the battery.

What is the SOC voltage chart for lithium batteries?

The SoC voltage chart for lithium batteries shows the voltage values with respect to SoC percentage. A Li-ion cell when fully charged at 100%SoC can have nearly 4.2V. As it starts to discharge itself, the voltage decreases, and the voltage remains to be 3.7V when the battery is at half charge, ie, 50%SoC.

Why is the voltage of a lithium ion battery inconsistent?

When the lithium-ion battery pack is produced and stored for a long time, due to the difference in static power consumption of each circuit of the protection board and the different self-discharge rate of each battery cell, the voltage of each string of batteries in the entire battery pack is inconsistent.
