What are the 6 types of solar panels?

The six main types of solar panels are polycrystalline, monocrystalline, thin-film, transparent, solar tiles, and perovskite. All of these are photovoltaic panels - meaning they use daylight to generate electricity - and they're all categorised based on their material. The 6 types of solar panels in 2025 | What solar panels should I get?

1.

What type of solar panel do I Need?

The type of solar panel you need depends on the type of system you want to install. For a traditional rooftop solar panel system, you'll usually want monocrystalline panels due to their high efficiency. If you have a big roof with a lot of space, you might choose polycrystalline panels to save money upfront.

What factors determine the voltage of a solar panel?

Factors such as solar panel type, number of panels in an array, and sunlight intensity determine the voltage of a solar panel. Cell type: There are numerous types of solar cells, but the four main types are monocrystalline, polycrystalline, PERC, and thin-film.

How many cells are in a solar panel?

A typical solar panel contains 60, 72, or 90 individual solar cells. There are 4 major types of solar panels available on the market today: monocrystalline, polycrystalline, PERC, and thin-film panels. Also known as single-crystal panels, these are made from a single pure silicon crystal that is cut into several wafers.

What factors should you consider when choosing a solar panel?

Common factors to consider when deciding between PV module types for residential purposes are cost, efficiency, durability, aesthetics, and warranty. There are many solar panel types, each with distinct characteristics, materials, efficiency rates, applications, and costs.

What is the best solar panel type?

Whilst monocrystalline is considered the best solar panel type and continues to dominate with a 90-95% share of the market, other panel types like PERC and thin-film panels are becoming increasingly common.
