Three lithium battery packs connected in series

Overview

To wire lithium batteries in series to increase voltage, connect the positive terminal of one battery to the negative terminal of the next. This setup means the voltage of each battery adds up, giving you the higher voltage you need for your project, but the amp-hour rating stays the same.

Wiring lithium batteries in series is a really straightforward way to increase their voltage. If you're looking at boosting voltage—for example, getting 7.4 volts from two cells or even 12.6 volts from three cells—this method is super important. Lithium batteries are part of our everyday gadgets.

Connecting lithium-ion batteries in parallel or in series is not as straightforward as a simple series-parallel connection of circuits. To ensure the safety of both the batteries and the individual handling them, several important factors should be taken into consideration. Before diving into the details, it's important to understand the basics of battery connections.

Lithium battery banks using batteries with built-in Battery Management Systems (BMS) are created by connecting two or more batteries together to support a single application. Connecting multiple lithium batteries into a string of batteries allows us to build a battery bank with the potential to power a wide range of applications.

Figure 2 shows two 12-volt batteries connected in series. The important things to note about a series connection are: The battery voltages add together to determine the battery pack voltage. In this example the resulting pack voltage is 24 volts. The capacity of the battery pack is the same as that of the individual batteries.

The first thing you need to know is that there are three primary ways to successfully connect batteries: The first is via a series connection, the second is called a parallel connection, and the third option is a combination of the two called a series-parallel connection. Connecting batteries in series is the most common method for increasing voltage.

I would like to connect 13S (48V nominal/~25Ah) lithium battery pack in series with a pack of 10 lithium cells (3.7V nominal/~30Ah) in order to get a 14S battery without tearing apart the original pack. I know it is not advised but since the original pack already has a BMS and since I would not.
